

Package ‘HYDAT’

February 7, 2017

Type Package

Title An interface to Canadian Hydrometric Data

Version 1.0

Date 2016-02-01

Author David Hutchinson

Maintainer David Hutchinson <david.hutchinson@canada.ca>

Description Access to Canadian water level, flow, and sediment data stored within the HYDAT database.

License GPL-3

Imports reshape2,
lubridate,
DBI

RoxygenNote 5.0.1

Description

Access to Canadian Hydrometric Data (HYDAT)

Details

Package: HYDAT
 Type: Package
 Version: 1.0
 Date: 2016-02-01
 License: GPL-3

The HYDAT package requires download of the SQLite version of the Canadian hydrometric database (HYDAT) from Environment and Climate Change Canada. The database contains over 1800 active and 7000 discontinued stations. Go to the following URL for more information: <https://www.ec.gc.ca/rhc-wsc/default.asp?lang=En&n=9018B5EC-1>

AnnualHydrometricData *Get mean annual hydrometric data for selected station(s)*

Description

Gets the mean annual hydrometric series (flow or level) for one or more stations. Flow units in m³/s; water level units in metres.

Usage

```
AnnualHydrometricData(con, get_flow = TRUE, station_number)
```

Arguments

| | |
|----------------|---|
| con | An open SQLite database connection to the HYDAT database |
| get_flow | Logical. If TRUE the function returns mean annual discharge, otherwise the function returns mean annual water level |
| station_number | A vector of Water Survey of Canada station identifiers |

Value

A data frame (station_number, year, mean)

See Also

[MonthlyHydrometricData](#)

[DailyHydrometricData](#)

AnnualInstantaneousPeakData

Gets the annual max/min instantaneous data for selected station(s)

Description

Gets the annual max/min instantaneous hydrometric series (flow or level). Data are usually defined to nearest minute in local standard time (see note below).

Usage

```
AnnualInstantaneousPeakData(con, get_flow = TRUE, station_number)
```

Arguments

| | |
|----------------|--|
| con | An open SQLite database connection to the HYDAT database |
| get_flow | Logical. If TRUE the function returns annual max/min instantaneous flow, otherwise the function return annual max/min instantaneous level for each station |
| station_number | A vector of Water Survey of Canada station identifiers |

Value

A data frame (station_number, year, peak_code, precision_code, month, day, hour, minute, time-zone, peak).

Note

In some cases, the timing of the instantaneous max/min may be uncertain due to equipment failure (e.g., recorder failure). Event timing may be censored by the hydrographer to reflect this uncertainty. This may lead to NA values for day or hour of occurrence. The precision_code is only valid for water level series and refers to the precision (mm or m) of the water level measurement (see [ReportedWaterLevelPrecision](#)).

See Also

[AnnualPeakData](#) for annual maximum/minimum hydrometric series. See [DataSymbols](#) for information on symbols associated with instantaneous peak values.

AnnualPeakData *Gets the annual max/min daily data for selected station(s)*

Description

Gets the annual maximum and minimum daily mean hydrometric series (flow or level). Flow units in m³/s; water level units in metres.

Usage

```
AnnualPeakData(con, get_flow = TRUE, station_number)
```

Arguments

con An open SQLite database connection to the HYDAT database

get_flow Logical. If TRUE the function returns the series of annual max/min daily flow, otherwise the function return the series of annual max/min daily level for each station

station_number A vector of Water Survey of Canada station identifiers

Value

A data frame (station_number, peak, year, month day, value, flag)

See Also

[AnnualInstantaneousPeakData](#) for annual instantaneous records, see [DataSymbols](#) for information on symbols associated with peak values.

DailyHydrometricData *Gets mean daily hydrometric data for selected station(s)*

Description

Gets the mean daily hydrometric series (flow or level) for one or more stations. Flow units in m³/s; water level units in metres.

Usage

```
DailyHydrometricData(con, get_flow = TRUE, station_number)
```

Arguments

con An open SQLite database connection to the HYDAT database

get_flow Logical. If TRUE the function returns mean daily discharge, otherwise the function returns mean daily water level

station_number A vector of Water Survey of Canada station identifiers

Value

A data frame (station_number, date, value, symbol)

Note

Symbols associated with mean daily hydrometric series are as follows "A" - manual gauge "B" - ice affected "D" - dry "E" - estimated

See Also

[AnnualHydrometricData](#) for mean annual data, [MonthlyHydrometricData](#) for mean monthly data, [DailySedimentData](#) for mean daily sediment load/concentration, [DataSymbols](#) for information on symbols associated with mean daily data, and [ReportedWaterLevelPrecision](#) for information on water level precision

| | |
|-------------------|--|
| DailySedimentData | <i>Gets mean daily sediment data for selected station(s)</i> |
|-------------------|--|

Description

Gets the mean daily suspended sediment (concentration or load) for one or more stations. Concentrations are measured in units of mg/L. Load are measured in tonnes (mean daily conc * mean daily flow * 0.0864).

Usage

```
DailySedimentData(con, get_load = TRUE, station_number)
```

Arguments

| | |
|----------------|---|
| con | An open SQLite database connection to the HYDAT database |
| get_load | Logical. If TRUE the function returns mean daily load, otherwise the function returns mean daily concentration. |
| station_number | A vector of Water Survey of Canada station identifiers |

Value

A data frame (station_number, date, value).

Note

Symbols associated with mean daily sediment series are as follows: «need further work here»

See Also

[DailyHydrometricData](#) for mean daily hydrometric data,
[DataSymbols](#) for information on symbols associated with mean daily data

 DataSymbols

DataSymbols

Description

Gets the description of data symbols applied to publication of daily hydrometric (flow,level) and suspended sediment concentrations

Usage

DataSymbols(con)

Arguments

con An open SQLite database connection

Value

A data frame (SYMBOL_ID, DESCRIPTION)

 MonthlyHydrometricData

Get mean monthly hydrometric data for selected station(s)

Description

Gets the mean monthly hydrometric series (flow or levels) for one or more stations. Flow units in m³/s; water level units in metres.

Usage

MonthlyHydrometricData(con, get_flow = TRUE, station_number)

Arguments

con An open SQLite database connection to the HYDAT database
 get_flow Logical. If TRUE the function returns mean annual discharge, otherwise the function returns mean annual water level
 station_number A vector of Water Survey of Canada station identifiers

Value

A data frame (station_number, year, month, monthly_mean, monthly_total)

Note

monthly_total is the total of the mean daily flow for each month that has complete data whereas monthly_mean is the average of the mean daily flow for each month that has complete data.

See Also[AnnualHydrometricData](#)[DailyHydrometricData](#)

| | |
|-----------------|---|
| MonthlySediment | <i>Get mean monthly sediment data for selected station(s)</i> |
|-----------------|---|

Description

Gets the mean monthly sediment (suspended or bedload) for one or more stations within the Water Survey of Canada hydrometric database (HYDAT). Suspended load measured in units of mg/l. Bedload measured in units of tonnes.

Usage

```
MonthlySediment(con, get_load = TRUE, station_number)
```

Arguments

| | |
|----------------|---|
| con | An open SQLite database connection to the HYDAT database |
| get_load | logical; TRUE to get bedload, FALSE to get suspended load |
| station_number | a vector of Water Survey of Canada station identifiers |

| | |
|--------------------------|---------------------------------|
| ParticleSizeDistribution | <i>ParticleSizeDistribution</i> |
|--------------------------|---------------------------------|

Description

Gets the particle size distribution (in millimetres) for sediment samples collected at various station locations

Usage

```
ParticleSizeDistribution(con, stationID)
```

Arguments

| | |
|-----------|--|
| con | an open SQLite database connection |
| stationID | A vector of Water Survey of Canada station identifiers |

Value

A data frame

| | |
|----------------|-----------------------|
| PrecisionCodes | <i>PrecisionCodes</i> |
|----------------|-----------------------|

Description

Gets the description of precision codes of water levels.

Usage

```
PrecisionCodes(con)
```

Arguments

| | |
|-----|------------------------------------|
| con | An open SQLite database connection |
|-----|------------------------------------|

Value

A data frame (PRECISION_CODE, DESCRIPTION)

| | |
|--------------|--|
| RealTimeData | <i>Gets current available data for hydrometric station</i> |
|--------------|--|

Description

Gets near real-time (within 6 hours) hydrometric data for the past 30 days for a particular hydro-metric station operated by the National Hydrological Service of Canada, Water Survey Division.

Usage

```
RealTimeData(base_url = "http://dd.weather.gc.ca/hydrometric", prov_terr_loc,
             station_number)
```

Arguments

| | |
|----------------|---|
| base_url | Base URL to access the data mart |
| prov_terr_loc | Two-digit provincial or territorial abbreviation in which the station is located (e.g., "BC") |
| station_number | A seven-digit station identifier (e.g., "08MF005") |

Value

A data frame (station_number, date_time, hg, hg_grade, hg_sym, hg_code, qr, qr_grade, qr_sym, qr_code)

Note

Returned date/times are in Universal Time Coordinated (UTC).

See Also

[RealTimeNetwork](#)

Examples

```
# get realtime data for Fraser River at Hope (08MF005)
data <- RealTimeData(prov_terr_loc="BC", station_number="08MF005")
plot(
  data$date_time, data$qv,
  type="l", col="blue",
  xlab="DateTime [UTC]", ylab="Discharge")
```

RealTimeNetwork

Get list of available hydrometric stations with near real-time data

Description

Gets the current list of hydrometric gauges available in near real-time (within 6 hours) from the National Hydrological Service, Environment and Climate Change Canada.

Usage

```
RealTimeNetwork(base_url = "http://dd.weather.gc.ca/hydrometric/doc",
  master_file = "hydrometric_StationList.csv")
```

Arguments

`base_url` Base URL to access data mart documentation

`master_file` Filename containing the list of available real-time stations

Value

A data frame (station_number, name, latitude, longitude, prov_terr_loc, timezone)

See Also

[RealTimeData](#)

Examples

```
network <- RealTimeNetwork()
# show top 50 stations
head(network, 50)
```

ReportedWaterLevelPrecision
ReportedWaterLevelPrecision

Description

Returns stated precision of water level (cm or mm) for each year of published record for a given hydrometric station.

Usage

ReportedWaterLevelPrecision(con, stationID)

Arguments

con an open SQLite database connection
stationID A vector of Water Survey of Canada station identifiers

Value

A data frame

SedimentSamples *Get miscellaneous sediment data*

Description

Gets sediment samples collected by Water Survey of Canada staff at various station locations. Sediment samples are categorized based on the sampling method (Environment Canada, 1988).

Depth-Integrating (DI) Method: Suspended sediment load estimated from 'n' equal-discharge segments in which sediment is sampled vertically through the water column at a uniform rate.

Point-Integrating (PI) Method: Suspended sediment load estimated from graphical methods.

Bed Material (BM): Samples of bed material often taken in same sampling verticals as suspended sediment or at waters edge. The total

obtained by either (1) Depth-Integrating Method or (2) Single Suspended

Usage

SedimentSamples(con, stationID)

Arguments

con an open SQLite database connection
stationID a vector of Water Survey of Canada station identifiers

Value

A data frame

References

Environment Canada, 1988. Miscellaneous Sediment Data 1966-1983, Inland Waters Directorate, Water Resources Branch, Water Survey of Canada, Ottawa, Canada. 248 p.

StationDataCollection *Gets data collection operations for selected hydrometric station(s)*

Description

Gets information on the station data collection schedules for one or more station(s). This includes observation (recorder/manual) and operation (seasonal/continuous) schedules for each variable recorded at each station.

Usage

```
StationDataCollection(con, station_number)
```

Arguments

con An open SQLite database connection to the HYDAT database
station_number A vector of Water Survey of Canada station identifiers

Value

A data frame (station_number, year_from, year_to, data_type, measurement, operation)

StationDataTypes *Gets list of variables available for hydrometric station(s)*

Description

Gets information on the variables (water level, flow, and sediment) collected at a station.

Usage

```
StationDataTypes(con, station_number)
```

Arguments

con An open SQLite database connection to the HYDAT database
station_number A vector of Water Survey of Canada station identifiers

Value

A data frame (station_number, data_type, sed_data_type, year_from, year_to, record_length, data_type_name, sed_data_type_name)

| | |
|-----------------|--|
| StationMetadata | <i>Gets relevant metadata for hydrometric station(s)</i> |
|-----------------|--|

Description

Gets relevant station metadata such as location, current operating status, real-time, and whether station is part of the Reference Hydrometric Basin Network (RHBN).

Usage

```
StationMetadata(con, station_number)
```

Arguments

| | |
|----------------|--|
| con | An open SQLite database connection to the HYDAT database |
| station_number | A vector of Water Survey of Canada station identifiers |

Value

A data frame (station_number, station_name, prov_ter_loc, hydrometric_status, sediment_status, latitude, longitude, drainage_area_gross, drainage_area_effective, rhbn, real_time, regional_office, contributor, operator, datum)

| | |
|-------------------|---|
| StationRegulation | <i>Gets regulation history for hydrometric station(s)</i> |
|-------------------|---|

Description

Extracts information on flow regulation history affecting a hydrometric station.

Usage

```
StationRegulation(con, station_number)
```

Arguments

| | |
|----------------|--|
| con | An open SQLite database connection to the HYDAT database |
| station_number | A vector of Water Survey of Canada station identifiers |

Details

A hydrometric station is deemed regulated if the natural flow regime is modified more than X

Value

A data frame (station_number, year_from, year_to, regulated) which outlines the period of regulation. If unregulated, then year_from will be an NA value.

| | |
|----------------|--|
| StationRemarks | <i>Gets ancillary remarks regarding hydrometric station data</i> |
|----------------|--|

Description

Provides further clarification on data stored in HYDAT database. Remarks are somewhat variable, but can provide further clarification on hydrometric series.

Usage

```
StationRemarks(con, station_number)
```

Arguments

| | |
|----------------|--|
| con | An open SQLite database connection to the HYDAT database |
| station_number | A vector of Water Survey of Canada station identifiers |

| | |
|---------|---|
| Version | <i>Gets current version of the HYDAT database</i> |
|---------|---|

Description

Determines the version and publication date of the HYDAT database

Usage

```
Version(con)
```

Arguments

| | |
|-----|--|
| con | An open SQLite database connection to the HYDAT database |
|-----|--|

Value

A data frame (version, date)
