

**Are legal and  
reputational  
challenges  
the main hurdles  
for GenAI?**

**We could try reducing  
the model's  
'temperature'**

Is this method alone sufficient?

**- No**

**1.**

**We could examine  
user requests  
to determine their  
appropriateness.**

**2.**

**We could validate and potentially regenerate an inappropriate AI response.**

**3.**

**We could archive  
all AI responses  
for further model  
tuning.**

# These points lead to other questions!

- Which models should we use for the validation process?
- Is it appropriate to use the AI model to validate its own responses?
- Should we consider using other models for this purpose?
